

Rumen Boost - Dairy

As regards nutrition, there are huge demands placed on the dairy cow in terms of milk production, often to the detriment of longevity, fertility and general health of the cow. It is therefore crucial that the cow gets as much nutrition as she can from her feed intake and not from her own body reserves.

Rumen Boost Dairy is specifically designed to:

- Deliver Bioplex® minerals such as copper, zinc and Sel-Plex® which have shown in trials by UCD to increase conception rate, decrease days to 1st service, decrease Somatic cell count and decrease lameness.
- Contain a number of rumen buffers which stabilise the rumen and ensure that the rumen is working effectively more of the time. These also help in the prevention of digestive disorders such as acidosis caused by high starch/sugar diets or lush spring grass.
- Maximise rumen efficiency with live yeast, Yeasacc®, which improves digestibility of feed and increases dry matter intakes which results in better milk yield.
- Increase feed conversion efficiency. Space in the rumen will limit what a dairy cow can physically eat so it is highly important that she gets to utilise the maximum amount of nutrients from this feed.
