

Rumen Boost - Beef

In modern day beef diets where it is crucial to push cattle to their maximum growth potential, there is a fine line between reaching this potential and introducing digestive upsets.

Rumen boost is a unique combination of ingredients specifically designed to:

- Enhance intakes.
- Maximise rumen efficiency.
- Increase feed conversion efficiency.
- Help in the prevention of digestive disorders such as acidosis.

How it works:

- Feed intakes are enhanced due to an increase in palatability. It also appeals to the animals sense of smell which further increases intake.
- Contains an unique ingredient which promotes development of the rumen wall to allow more nutrient uptake.
- Contains a number of rumen buffers which work at different pH's in order to stabilise natural acids in the animal. With a more stable pH in the rumen it allows the rumen bacteria and live yeasts to be more active in breaking down fibre. This is also key to preventing acidosis.
- Contains live yeast, YeaSacc® proven in trials to increase live weight gain by 11% and improve overall kill out %.
