

# Lung Booster

Available in Nugget Calf and Weanling feedstuffs.

## Prevention is better than cure

There is much stress on the animal at housing including transport, dosing, penning together in new groups. All of which puts extra pressure on the immune system, and as a result the major concern for most farmers at this time of the year is pneumonia.

### What can be done?

There are various options open to the farmer, including vaccination and antibiotic treatment. Both of which are effective and very specific in their control.

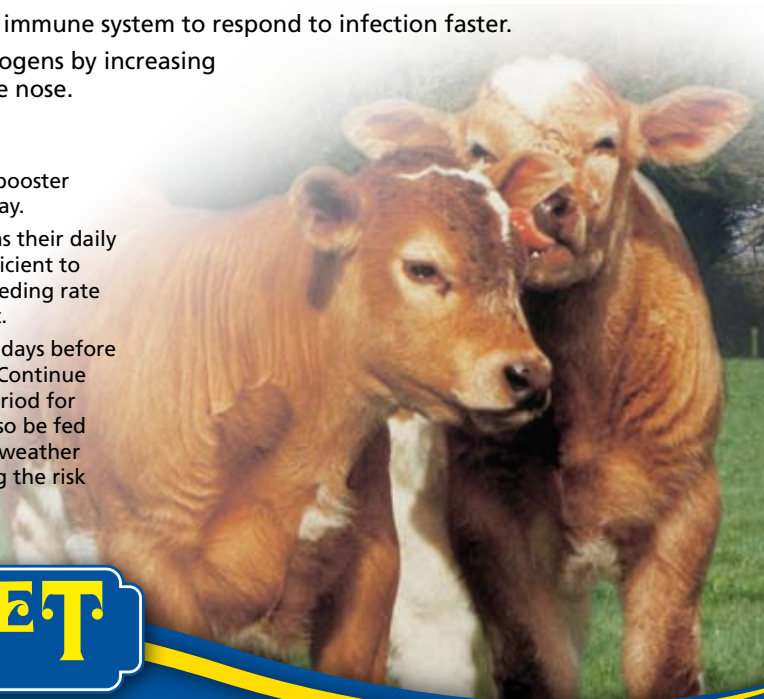

- Lungbooster, is a cost effective solution for respiratory support.
- Facilitates breathing and reduces panting.
- Helps the immune system with a natural antibacterial effect.
- Stimulates the animals immune system to respond to infection faster.
- Removes harmful pathogens by increasing flow of mucus from the nose.

### Recommended feeding:

1kg of Nugget Feed + Lungbooster per 100kgs liveweight per day.

**Calves:** Can be fed as soon as their daily concentrate intakes are sufficient to match the recommended feeding rate of 1kg per 100kg liveweight.

**Weanlings:** Should be fed 7 days before any expected stress period. Continue feeding during the stress period for at least 2 weeks. It should also be fed during periods of very mild weather conditions to aid in reducing the risk of respiratory problems.

# Lungbooster Plus

Available in Wonderthrive Calf Milk Replacer with Lungbooster Plus.

This unique health package is added to wonderthrive milk replacer, targeted at assisting the calf's immune system against both respiratory and digestive diseases.

The young calf is very efficient at converting feed to liveweight gain but is also highly susceptible to diseases until it develops its own immunity.

- Has all the same respiratory benefits of lungbooster - clearing the airways, less breathing problems.
- Fortified with an extra ingredient that helps improve the health of the intestine wall.
- Oocytes associated with cryptosporidia and coccidia will pass through the intestine unable to develop thus protecting the calf from infection.
- Calves are a lot more vulnerable to other infections when these pathogens are building up in the calf's system.
- Results in a healthier gut which gives better absorption of nutrients in the intestines.

## Warnings:

Feedstuffs containing Lungbooster should only be used as part of your normal Pneumonia prevention program. It is **NOT** to be used as a substitute for good management or normal vaccination and antibiotic treatments.

Most animals will exhibit runny noses for up to 5 days after being introduced to feedstuffs with Lungbooster. This is part of the natural cleansing that Lungbooster causes so there is no need to be alarmed in the absence of other symptoms of ill health. If it persists for any longer than 5 days, or if in doubt whatsoever, consult your vet immediately.

*Always the Best*
