

EARLY GRAZE CALF NUTS

Unlock the Real Potential of Grass for Your Calves

Always the best

EARLY GRAZE CALF NUTS

Always the best

On many farms, calves get varying degrees of scour when they go to grass. This can cause serious damage to their overall health & long term thrive, particularly in younger calves. Calves get these summer scours for a variety of reasons including, molybdenum toxicity, coccidiosis, wet grazing conditions, stress, worm infestation etc. Very often, the root cause of the scouring is a combination of several of factors, rather than one.

That said, Acidosis is often the primary reason for this scouring. Calves tend to get put out on the best pastures, where they have access to plentiful supplies of highly digestible, low fibre grass. This grass-based diet is very different to the concentrate + straw or hay-based diet the calf was most likely reared on, while indoors. This lush grass breaks down much faster in the rumen than hay /straw-based diets and this can lead to a rapid build- up of acid (Acidosis) leading to the digestive upset and scour we see.

High starch, low fibre concentrates such as our Super Grow Calf Nut, that deliver very high performance when fed indoors and/or on more stemmy pastures, may not work quite as well on these lush pastures. With that in mind we have introduced Nugget Early Graze Calf Nuts.

These are very similar in many respects to Super Grow Calf Nuts but differ in that they are designed specifically to help prevent Acidosis and enable the calf to make best use of a grass-based diet.

	EARLY GRAZE CALF NUTS	SUPER GROW CALF NUTS
UFL (AS FED)	0.96	0.96
Cr. Protein	17%	17%
Cr. Fibre	13%	7%
Starch	14%	24%
*Grennan Super Calf Mineral Package	Included	Included
